Write a program to demonstrate generics with multiple object parameters.

```java
class generics<T,S>{
    private T t;
    private S s;

    void get(T t,S s)
    {
        this.t=t;
        this.s=s;
    }
    T getfirst()
    {
        return t;
    }
    S getsecond()
    {
        return s;
    }
}
class multi_gnrc{
    public static void main(String[] args)
    {
        generics<String,String> p1= new generics<String,String>();
        p1.get("Mahesh","CSE");
        System.out.println(p1.getfirst());
        System.out.println(p1.getsecond());
    }
    }
```

OUTPUT:

```
C:\Users\hp\Desktop>java multi_gnrc
Mahesh
CSE

C:\Users\hp\Desktop>_
```
